

Listing of the Claims

1. (previously presented) An imaging device with white balance adjustment, comprising:

image capture circuitry configured to produce captured image signals under identical illumination conditions for each of a standard calibration target to provide a first reference metric under the identical illumination conditions and for a nonstandard calibration target to produce a second reference metric under the identical illumination conditions,

means for capturing a second group of captured image signals from the nonstandard calibration target under changed illumination conditions that differ from the identical illumination conditions to produce a third reference metric, and;

means for adjusting white balance in the second group of captured image signals by relating the third reference metric to the second reference metric.

2. (Original) The imaging device of claim 1, wherein the image capture circuitry includes a detector selected from the group consisting of a CCD detector array and a CMOS detector array.

3. (Original) The imaging device of claim 2, wherein the means for adjusting white balance include signal processing circuitry capable of changing variable gain coefficients enabled on the charge coupled device

array.

4. (previously presented) The imaging device of claim 3, wherein the means for adjusting comprises an algorithm for relating a field image of a non-standard target to a primary image of a standard calibration target through use of the second reference metric.

5. (Original) The imaging device of claim 4, wherein the algorithm is operable for:

determining at least one variable gain coefficient for the field image,

determining at least one variable gain coefficient for the primary image,

relating the variable gain coefficient for the field image to the variable gain coefficient for the primary image to produce an adjusted variable gain coefficient, and

supplying the adjusted variable gain coefficient to the means for adjusting white balance.

6. (cancelled)

7. (previously presented) The imaging device of claim 1, wherein the nonstandard calibration target is a human hand.

8. (previously amended) A method for adjusting white balance in an imaging device, the method comprising the steps of: capturing image signals under identical illumination conditions for each of a standard calibration target to

provide a first reference metric under the identical illumination conditions and for a nonstandard calibration target to produce a second reference metric under the identical illumination conditions,

capturing a second group of captured image signals from the nonstandard calibration target under changed illumination conditions that differ from the identical illumination conditions to produce a third reference metric, and;

adjusting white balance in the second group of captured image signals by relating the third reference metric to the second reference metric.

9. (original) The method of claim 8, wherein the step of adjusting white balance comprises enabling an adjusted variable gain coefficient on a variable gain amplifier.

10. (original) The method of claim 9, wherein the step of enabling an adjusted variable gain coefficient comprises calculating a relationship between a variable gain coefficient for the field image and a variable gain coefficient for the primary image.

11. (previously presented) The method of claim 10, wherein the step of calculating includes: determining at least one variable gain coefficient for the field image, determining at least one variable gain coefficient for the primary image, relating the variable gain coefficient for the field image to the variable gain coefficient for the primary image to produce the adjusted variable gain coefficient, and supplying the adjusted variable gain coefficient to signal

processing circuitry for use in normal photography.

12. (original) The method of claim 8, wherein the step of capturing image signals includes capturing the field image from the non-standard calibration target selected from the group consisting of a palm, a wallet, and a camera lens cover.

13-17 (canceled).
